

The purpose of our tinting restriction is to ensure that following drivers have an unobstructed view into and through your car. Our restrictions apply only to the front and rear windshields. Side windows are not an issue. Some time ago we tried to quantify the amount of tinting allowed, but the effort was made overly complicated by several variables, two being the type of tinting and the angle of the rear windshield. So we reverted to the old calibrated eyeball.

It is virtually impossible for us to approve unconditionally your tinting without our seeing it. With good photos I usually get a good idea, enough so that I can give a One-Time Exemption that will allow you to run and we can make a determination about future events so you will not have to go through this every time.

Please send me a photo following these directions. **Shoot outdoors in daylight with no flash from about 15 ft. from the rear while looking through the rear window into the interior. Stand directly behind the car and hold the camera about 4 feet from the ground. Situate the car such that there are no shadows falling on the rear glass. The rear license plate must be readable in the photo. It is very help full to have something of contrast if front of your car. The inside of a dark garage is the worst.** This isn't the latest in award winning photography; the subject of photo is whatever is in front of your car as seen by the driver of the car behind. Based on a good photo we will try to give you a one-time exemption for the event which will allow us to see the car in person for evaluation regarding future events.

Please forward your photo to Warren Brown, Chief of Tech
